GLOBAL WHITEPAPER

# AAA AI Business OS

One operating system for chats, planning, durable execution, email, voice, calls, forecasting, wallet and cards.

WHITEPAPER · 02

# The thesis: work does not fit in one chat box.

Business work is a loop: a conversation becomes a decision, a decision becomes a plan, a plan becomes execution, and execution produces evidence. Most AI products optimize one box in that loop. AAA AI owns the loop.

The platform combines multi-expert reasoning, a Slack-style workspace, a native project system, durable multi-agent flows, approval-gated email, voice and calls, swarm forecasting, and stable-value payments. Every surface shares one account, one identity and one audit trail.

**9**
product surfaces in one OS

**163**
native integrations · 3,000+ connectors

## Why now

- Agents can act, not just answer — but action needs approvals, evidence and spend control.
- Teams already run chat, email, calls, projects and payments in separate tools; the context is lost at every boundary.
- Enterprises need a deployment they control: cloud, VPC, on-prem or offline.

> The operating system is the product. Each surface makes the next one more useful.

WHITEPAPER · 03

# The product suite.

## Nine surfaces, one account

| SURFACE | WHAT IT DOES |
|---|---|
| **Chats** | Multi-expert reasoning plus channels, DMs, huddles, files and calls with AI notes. |
| **Plan** | Projects, issues, cycles, initiatives, docs, dashboards, AI agents, Git and Slack. |
| **Agent Flows** | Durable YAML runs, tool allowlists, approvals, parallel agents, event log, resume and run chat. |
| **Prediction** | Seed evidence → knowledge graph → persona swarm → interventions → decision-ready report. |
| **Email** | 24 providers, OAuth, triage, summaries and approval-gated drafts. |
| **Voice Studio** | Profiles, cloning, multi-provider TTS and voice agents with knowledge/rules. |
| **Meet** | Voice/video, guest links, recordings and live AI notes. |
| **Wallet** | AAA stablecoin wallet, 1:1 conversion, public/private settlement, scoped agent keys. |
| **Cards** | VISA virtual $15 and physical $70, funded from a separate USDT account. |

The surfaces are connected by the same thread, task, run, customer and payment. A chat can create a Plan issue; a Plan issue can trigger a Flow; a Flow can send an approval-gated email; a call can produce a Plan task.

# Architecture and control.

## Architecture

- **Surfaces**: web, iOS, Android, macOS Chat & IDE, CLI TUI, desktop agents, Telegram, Discord, Slack.
- **Orchestration**: expert pipeline, agent teams, Agent Flows, task board, scheduled runs.
- **Context**: memory, documents, project graph, email, calls, forecasts and workspace history.
- **Models**: local Ollama/MLX, private endpoints, cloud APIs or a mixed router.
- **Control**: approvals, scoped credentials, agent spend limits, audit logs, data guard.

## Deployment

SaaS at web.aaaai.me or self-host with Docker/Terraform; cloud, VPC, on-prem or fully offline. BYO keys, local models and customer-controlled storage are first-class modes, not demos.

## Commercial model

Free → Pro at $20/month → Team/Enterprise, plus wallet settlement and card rails. Plan, Agent Flows and Prediction are included product surfaces, not separate SKUs.

WHITEPAPER · 05

# Governance, rollout and next steps.

## Governance

- Human approval is explicit in email, Plan agent runs and Agent Flows; auto modes are opt-in.
- Agent spend is bounded by per-transaction and 24-hour limits, with scoped keys and audit trails.
- Every Plan agent run and Flow step persists prompt, status, output and evidence.
- Data residency follows the deployment boundary; enterprise SSO/RBAC and retention are configuration.

## 90-day rollout

1. **Week 1–2**: one team, chat + Plan, one mailbox in approval-only mode.
2. **Week 3–6**: first Agent Flow with an approval gate; connect Git and Slack.
3. **Week 7–10**: calls and Voice Studio for a repeated workflow; Prediction for one live scenario.
4. **Week 11–12**: measure cycle time, approval latency and rework; expand seats.

## Whitepaper library

Chat, Plan, Agent Flows, Prediction, Email, Voice Studio, Meet, Wallet and Cards each have a dedicated technical whitepaper. This global paper is the map; the product papers are the detail.

> Own the loop, not another chat window.
