MEET

Meet

Live voice and video calls with guest links, recordings and AI notes — summary, plan, decisions and actions attached to the conversation.

WHITEPAPER · 02

Calls that leave a work product.

Meet turns a call into a working record. Participants join from web or native clients; the default planner model produces live notes while people speak, then the conversation continues in chat, tasks and workflows.

Capabilities

- **Voice and video** for one-to-one and group conversations, with invite links.
- **Screen share** and in-call controls.
- **Live AI notes**: summary, working plan, decisions and action items with participant consent.
- **Recordings and transcripts** saved with the conversation.
- **After the call**, the same thread continues in Chat, Plan or a Flow.

WHITEPAPER · 03

Governance and deployment.

Controls

- Consent and recording policy are surfaced in the room; recording is explicit.
- Guest links are scoped to the call and can be revoked.
- Notes attach to the room; retention follows the workspace policy.
- Native clients share the signed session and system camera/microphone permission.

Limits

Screen capture depends on the embedded browser on mobile. A call is not a replacement for a full telephony stack; it is the collaboration surface inside the OS. Product URL: web.aaaai.me/meet · Docs: aaaai.me/docs.html#meet.
